

# LIRC on Raspberry Pi

# LIRC

setup and usage

# Setup

- download software
- enable
- configure
- for details:
  - <http://alexba.in/blog/2013/01/06/setting-up-lirc-on-the-raspberrypi/>
- set the gpio pins for the IR Recvr, in /etc/modules

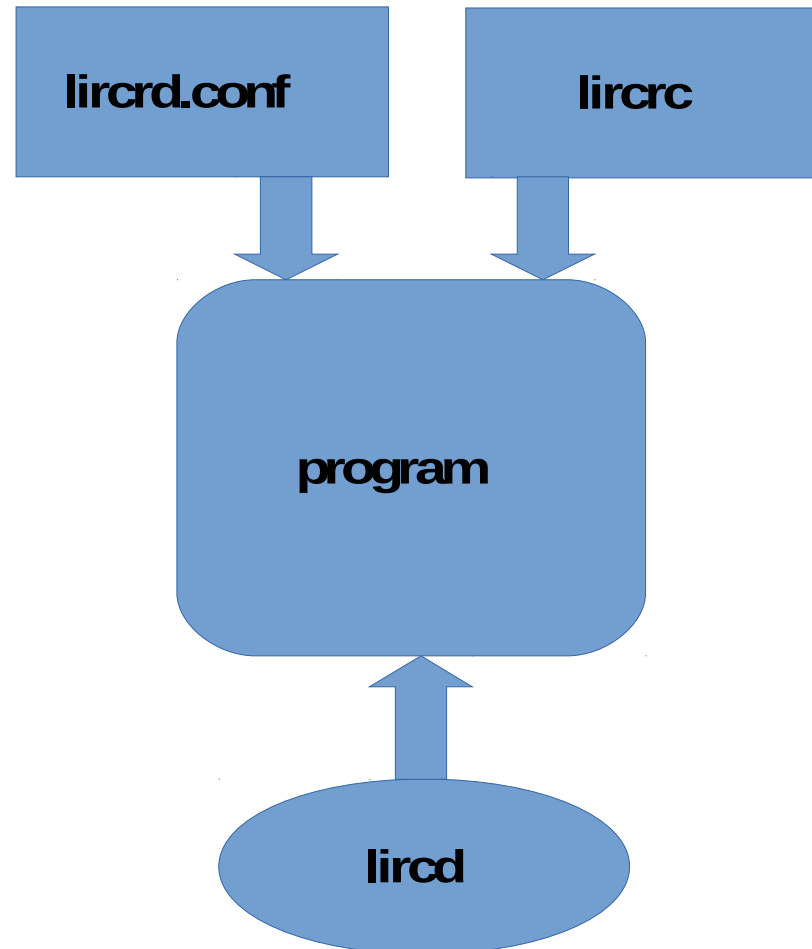

# Programming

- Need to configure the remote device – `lircd.conf`
  - can use `irrecord`, or if a conf file exists use it
- Need to configure the `lircrc` file
- Program:
  - The program opens the `lircrc` file with `lirc.init()`, and looks for 'prog'
  - The program checks for 'config' given a keypress defined by 'button' via the `lirc.nextcode()`

# flow

# Example

- `lircd.conf`:

Lines like this define all IR codes: `KEY_STOP 0x20DF`

- `lircrc`:

```
begin
  prog = setalarm
  button = KEY_STOP
  config = stop
end
```

- `lircrc` rules: see <http://www.g-loaded.eu/2006/01/10/how-to-configure-and-use-lirc/>

- `program`

```
lstat = lirc.init( 'setalarm', '/etc/lirc/lircrc', 1)
x = lirc.nextcode()[0]
if (x == 'enter' or x == 'stop'):
  break
```
